2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☐ Responsive to communication(s) filed on \_\_\_\_.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-16 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-16 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 16 January 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- ☒ Notice of References Cited (PTO-892)
- ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_.
- ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_.
- ☐ Notice of Informal Patent Application (PTO-152)
- ☐ Other: \_\_\_\_.

## DETAILED ACTION

### ***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claim 1 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 1 contains functional language to describe what the apparatus does rather than what the apparatus is. The means by which the disclosed functions are performed are not particularly pointed out and distinctly claimed, thus making claim 1 indefinite.

Please refer to MPEP §2173.05(g).

### ***Claim Rejections – 35 USC §102***

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Sasanuma (US Patent 5,719,681).

**Regarding claim 1:** Sasanuma discloses an image forming apparatus (figure 2 of Sasanuma) which forms an image on an image forming medium (column 4, line 66 to

Art Unit: 2624

column 5, line 3 of Sasanuma) and which can form a specific hidden pattern for specifying an apparatus (column 10, lines 30-33 of Sasanuma) at a specific position on said medium (column 10, lines 25-29 of Sasanuma).

Sasanuma further discloses that both a software control signal generated by software (PS) (column 9, lines 55-57 of Sasanuma) and a hardware control signal which is generated by hardware (H) (column 5, line 64 to column 6, line 3 of Sasanuma) and necessarily used for forming an image on said medium (column 10, lines 60-62 of Sasanuma) are used as control signals for adding said specific hidden pattern when said specific hidden pattern is added to a specific position on said medium to form said image (column 10, lines 55-62 of Sasanuma).

### ***Claim Rejections – 35 USC §103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claim 2-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sasanuma (US Patent 5,719,681) in view of Burns (US Patent 5,936,741).

**Regarding claim 2:** Sasanuma discloses that said apparatus comprises image data supplying means (figure 2(210-1, 210-2, 210-3, and 401-406) of Sasanuma) for supplying color image data (column 5, lines 26-33 of Sasanuma). CCD line sensors (figure 2(210-1,210-2,210-3) of Sasanuma) detect RGB signals and output digital

representation of the RGB signals (column 5, lines 26-33 of Sasanuma). Delay elements (figure 2(401-402) of Sasanuma) compensate for delays resulting from the physical spacing of said CCD line sensors (column 5, lines 34-37 of Sasanuma). The log converters (figure 2(403-405) of Sasanuma) convert brightness to density (column 5, lines 38-40 of Sasanuma) and the masking UCR circuit (figure 2(406) of Sasanuma) converts the RGB data to CMYK data (column 5, lines 40-46 of Sasanuma).

Said apparatus further comprises data existence/absence confirming means (figure 3(301-303,310) of Sasanuma) for confirming the existence/absence of image data in said image forming apparatus (column 5, lines 64-67 of Sasanuma). Portions (figure 3(301-303,301) of Sasanuma) of the determination circuit (figure 2(409) of Sasanuma) determine the existence/absence of specific originals that should not be copied (column 5, lines 64-67 of Sasanuma). The remaining portion is the maximum value circuit (figure 3(309) of Sasanuma), which outputs the determination signal, as discussed below.

Said apparatus further comprises hardware control signal supplying means (figure 3(309) of Sasanuma) for generating and supplying said hardware control signal (H) based on the existence/absence of image data confirmed by said confirming means (column 5, line 67 to column 6, line 3 of Sasanuma). As can be seen from figure 3, the maximum value circuit (figure 3(309) of Sasanuma) is the portion of said determination circuit that outputs the determination signal (H).

Said apparatus further comprises software control signal supplying means (figure 2(414-416) of Sasanuma) for generating and supplying said software control signal (PS)

Art Unit: 2624

for adding a specific hidden pattern (column 9, lines 55-57 of Sasanuma). The control signal PS is generated by the CPU (figure 2(414) of Sasanuma) (column 9, lines 55-57 of Sasanuma). Said CPU processes software stored in the ROM (figure 2(415) of Sasanuma) (column 5, lines 55-58 of Sasanuma) and uses the RAM (figure 2(416) of Sasanuma) as a work area (column 5, lines 58-60 of Sasanuma). The software control signal supplying means is therefore the associated software physically embodied in an associated portion of said ROM, processed by said CPU, using said RAM as a work area.

Said apparatus further comprises control signal synthesizing means (figure 2(414-416) of Sasanuma) for synthesizing a control signal in such a manner that said specific hidden pattern is necessarily formed on a color image (column 9, lines 54-60 of Sasanuma) when a usual image is formed on said image forming medium based on said hardware control signal (H) and said software control signal (PS) (column 10, lines 55-62 of Sasanuma).

Said apparatus further comprises hidden pattern generating means (figure 11(906-909) of Sasanuma) for generating said specific hidden pattern (column 9, lines 54-55 and column 9, line 65 to column 10, line 9 of Sasanuma). The registers (figure 11(906-909) of Sasanuma) store the hidden pattern values (column 9, lines 54-55 of Sasanuma). One of said patterns is specifically selected to be output (column 9, line 65 to column 10, line 4 of Sasanuma), and then added to the signal (column 10, lines 5-9 of Sasanuma).

Said apparatus further comprises pattern selecting means (figure 11(910) of Sasanuma) for selecting and outputting one of said specific hidden pattern based on said control signal synthesized by said control signal synthesizing means (column 9, line 65 to column 10, line 4 of Sasanuma).

Said apparatus further comprises image formation output signal synthesizing means (figure 11(912) of Sasanuma) which synthesizes said color image data supplied from said image data supplying means and said specific hidden pattern selected by said pattern selecting means when said image data is inputted (column 9, lines 58-60 and column 10, lines 5-9 of Sasanuma).

Sasanuma does not disclose expressly a test pattern generating means for generating and outputting a test pattern when a color image is not formed. Sasanuma does not disclose expressly that said pattern selecting means can further select said test pattern based on said control signal synthesized by said control signal synthesizing means. Sasanuma does not disclose expressly that said image formation output signal synthesizing means outputs said test pattern selected by said pattern selecting means when said color image data is not inputted.

Burns discloses test pattern generating means (figure 2(28) of Burns) for generating and outputting a test pattern (figure 1(10) of Burns) when an image is not formed (column 8, lines 34-37 of Burns). The test pattern is printed on the entire medium, as clearly shown in figure 1(10) of Burns, therefore a particular scanned image is not being formed on said medium. Said test pattern can be selected based on a control signal (column 7, lines 55-60 of Burns).

Sasanuma and Burns are combinable because they are from the same field of endeavor, namely digital image processing. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to including a test pattern generating means, as taught by Burns, and include the test pattern as a selection in the pattern selection means taught by Sasanuma. Said test pattern would then be output when there is no image data for said image forming apparatus, as taught by Burns, and output for each of the colors of the image forming apparatus taught by Sasanuma. The motivation for doing so would have been that a test pattern is used to properly calibrate the apparatus (column 7, lines 55-57 of Burns). Therefore, it would have been obvious to combine Burns with Sasanuma to obtain the invention as specified in claim 2.

**Regarding claim 3:** Sasanuma discloses that said hardware control signal (H) generated by said hardware control signal supplying means is a signal which affects the addition of said specific hidden pattern (column 10, lines 58-62 of Sasanuma) and which avoids the normal formation of a usual image when said signal is abnormal (column 10, lines 62-65 of Sasanuma).

**Regarding claim 4:** Sasanuma discloses that said hardware control signal can be generated by software when said signal is set (figure 15 and column 10, lines 58-62 of Sasanuma). After said hardware control signal (H) is set, said software control signal (PS) is compared with said hardware control signal (column 10, lines 59-61 of Sasanuma). Since said comparison is performed with software (column 5, lines 55-58 and column 9, lines 55-57 of Sasanuma), it is inherent that, after said hardware control signal is set, said hardware control signal is generated by software. Otherwise, a

comparison signal in software with which to compare said software control signal would not exist.

**Regarding claim 5:** Sasanuma discloses that said specific hidden pattern generated by said hidden pattern generating means is a special pattern formed by using colors or patterns which are hard to be identified by the naked eye (column 10, lines 10-14 of Sasanuma) in such a manner that a body of an image forming apparatus which has formed an image can be specified from a reproduced image on said medium, even if a specific original which must not be inherently formed is formed on said medium (column 10, lines 14-19 of Sasanuma).

**Regarding claim 6:** Sasanuma discloses that said data existence/absence confirming means generates said hardware control signal for said hardware control signal supplying means (column 5, line 64 to column 6, line 3 of Sasanuma), when image data is supplied from said image data supplying means (column 5, lines 64-66 of Sasanuma).

**Regarding claim 7:** Sasanuma discloses that said control signal synthesizing means (figure 2(414-416) of Sasanuma) comprises circuitry for calculating a comparison of said hardware control signal supplied from said hardware control signal supplying means and said software control signal supplied from said software control signal supplying means (column 10, lines 55-62 of Sasanuma), and outputs a control signal by which a specific hidden pattern is selected and necessarily added to an image (column 10, lines 5-9 of Sasanuma). The CPU (figure 2(414) of Sasanuma) is inherently comprised of circuitry such as OR circuits, circuits that perform comparisons,

AND circuits, and register circuits, among others. It is through applying software to a plurality of the circuits comprising CPUs that CPUs function. The functions that software codes perform determine which circuits comprising the CPU are used.

Sasanuma does not disclose expressly that said OR circuit comprising said control signal synthesizing means calculates the logical OR of said hardware control signal supplied from said hardware control signal supplying means and said software control signal supplied from said software control signal supplying means, and outputs a control signal by which a specific hidden pattern is necessarily added to an image when one of said hardware control signal and said software control signal is supplied.

Burns discloses specifically setting a test pattern to be printed by setting a control signal (column 8, lines 57-60 of Burns).

Sasanuma and Burns are combinable because they are from the same field of endeavor, namely digital image processing. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to specifically set said software control signal (PS) if a particular hidden pattern is desired. Therefore, if either said hardware control signal (H) or said software control signal (PS) is set to a particular hidden pattern, said hidden pattern will be selected for output. This effectively calculates a logical OR of said hardware control signal supplied from said hardware control signal supplying means and said software control signal supplied from said software control signal supplying means. The motivation for doing so would have been to select a set of image data that is appropriate to the current system conditions

(column 8, line 66 to column 9, line 2 of Burns). Therefore, it would have been obvious to combine Burns with Sasanuma to obtain the invention as specified in claim 7.

**Regarding claim 8:** Sasanuma discloses that said pattern selecting means comprises a selector (figure 11(910) of Sasanuma) for selecting said specific hidden pattern generated by said hidden pattern generating means with said control signal (column 9, line 66 to column 10, line 4 of Sasanuma) for adding said specific hidden pattern to an output image as a selected input by said control signal synthesizing means (column 10, lines 5-9 of Sasanuma).

**Regarding claim 9:** Sasanuma discloses that said image formation output signal synthesizing means outputs to a printer engine (column 5, lines 4-7 of Sasanuma) an image formation signal by which a hidden pattern (column 10, lines 10-13 of Sasanuma) using a predetermined color or pattern is added (column 10, lines 29-33 of Sasanuma) at a predetermined position of an image to be formed (column 10, lines 27-29 of Sasanuma) by adding said specific hidden pattern supplied from said pattern selecting means to said image data supplied from said image data supplying means (column 10, lines 5-9 of Sasanuma).

**Regarding claim 10:** Sasanuma discloses that said image data supplying means comprises a yellow data supplying apparatus (figure 2(406) of Sasanuma) for supplying yellow image data to each of said image formation output signal synthesizing means and said hardware control signal supplying means (column 5, lines 41-46 of Sasanuma). The masking-UCR circuit (figure 2(406) of Sasanuma) supplies image data for each of the four CMYK colors (column 5, lines 41-46 of Sasanuma) including

yellow image data (column 5, lines 43-44 of Sasanuma). The part of said masking-UCR circuit that specifically supplies the yellow image data corresponds to the yellow data supplying apparatus.

**Regarding claim 11:** Sasanuma discloses that said hardware control signal supplying means (figure 2(414-416) of Sasanuma) comprises a portion which outputs a signal (H) (column 5, line 64 to column 6, line 3 of Sasanuma) selecting a specific hidden pattern (column 10, lines 55-62 of Sasanuma). Said hidden pattern is yellow image data (column 10, lines 10-11 of Sasanuma) formed in specific size blocks which are repeated throughout the output image (column 10, lines 27-29 of Sasanuma). Said yellow image data is output to an external printer (column 9, lines 61-64 of Sasanuma). The specific size blocks are therefore comprised of external yellow sub scanning direction (column 10, line 29 of Sasanuma) image data based on said yellow image data (column 10, lines 10-11 of Sasanuma). The output of said hardware control signal supplying means would therefore be a -YVDEN signal enabling an external yellow sub scanning direction image based on said yellow image data.

**Regarding claim 12:** Sasanuma discloses that said control signal synthesizing means (figure 2(414-416) of Sasanuma) comprises circuitry for calculating a comparison of said -YVDEN signal (H) supplied from said hardware control signal supplying means and an output signal (PS) from a specific pattern addition signal generating register (column 10, lines 55-62 of Sasanuma), and outputs a control signal by which a specific hidden pattern is selected and necessarily added to an image (column 10, lines 5-9 of Sasanuma). The CPU (figure 2(414) of Sasanuma) is

inherently comprised of circuitry such as OR circuits, circuits that perform comparisons, NOT circuits, and register circuits, among others. It is through applying software to a plurality of the circuits comprising CPUs that CPUs function. The functions that software codes perform determine which circuits comprising the CPU are used. The use of said circuits would therefore further include a register which generates a signal (PS) for adding a specific pattern since said signal requires storage in some form. Furthermore, it would be an obvious design choice to use a single active-low signal bit for said -YVDEN signal (H) and a single active-high signal bit for said output signal (PS) from said specific pattern addition signal generating register, since use of such single bit signals would simply indicate whether or not a hidden pattern is to be used. The use of a single bit for a signal and the use of an active low signal are old, well-known and commonly used in the digital data processing arts.

Sasanuma does not disclose expressly that said control signal synthesizing means comprises a NOT circuit which inverts said external yellow sub scanning direction image enabled signal (-YVDEN) outputted from said -YVDEN output portion as said hardware control signal supplying means and an OR circuit for calculating the logical OR of an output from said NOT circuit and an output signal from a specific pattern addition signal generating register as said hardware control signal supplying means.

Burns discloses specifically setting a test pattern to be printed by setting a control signal (column 8, lines 57-60 of Burns).

Sasanuma and Burns are combinable because they are from the same field of endeavor, namely digital image processing. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to specifically set said output signal (PS) if a particular hidden pattern is desired. Therefore, if either said –YVDEN signal (H) or said output signal (PS) is set for outputting a hidden pattern, then a hidden pattern will be selected for output. Said –YVDEN signal (H) would have to be inverted in order to coincide with the same digital logic as said output signal (PS). This effectively calculates a logical OR of the inverted –YVDEN signal and said output signal. The motivation for doing so would have been to select image data when said image data is appropriate to the current system conditions (column 8, line 66 to column 9, line 2 of Burns). Therefore, it would have been obvious to combine Burns with Sasanuma to obtain the invention as specified in claim 12.

**Regarding claim 13:** Sasanuma discloses that said data existence/absence confirming means generates a hardware control signal in said hardware control signal supplying means (column 5, line 64 to column 6, line 3 of Sasanuma). Said hardware control signal (H) selects a specific hidden pattern (column 10, lines 55-62 of Sasanuma). Said specific hidden pattern is comprised of specific size blocks of image data which are tiled across the output image (column 10, lines 27-29 of Sasanuma) and printed on an external printer (column 9, lines 61-64 of Sasanuma). An external printer inherently requires some form of control signal for controlling drive of a paper carrying motor for carrying paper. Said paper is the image forming medium (column 5, lines 16-19 of Sasanuma). Therefore, the hardware control signal is based on a control signal

for controlling drive of a paper carrying motor for carrying paper as said image forming medium.

**Regarding claim 14:** Sasanuma discloses that said pattern selecting means comprises a selector (figure 11(910) of Sasanuma) for selecting said specific hidden pattern generated by said hidden pattern generating means with said control signal (column 9, line 66 to column 10, line 4 of Sasanuma) by which said specific hidden pattern is added to an output image by said control signal synthesizing means as a selected input (column 10, lines 5-9 of Sasanuma).

**Regarding claim 15:** Sasanuma discloses that said hidden pattern generating means (figure 11(906-910) of Sasanuma) comprises a specific pattern generating portion (figure 11(909-910) of Sasanuma) for generating a specific hidden pattern (column 9, lines 54-55 and column 9, line 65 to column 10, line 4 of Sasanuma). A specific pattern (P4) is stored in a register (figure 11(909) of Sasanuma) (column 9, lines 54-55 of Sasanuma) and selected by a selector (figure 11(910) of Sasanuma) when the appropriate input signal is received (column 9, line 65 to column 10, line 4 of Sasanuma).

**Regarding claim 16:** Sasanuma discloses that said image formation output signal synthesizing means comprises an adder (figure 11(912) of Sasanuma) which outputs to a printer engine an image formation signal (column 10, lines 5-9 of Sasanuma) by which a hidden pattern using a predetermined color or pattern is added (column 10, lines 10-11 of Sasanuma) at a predetermined position of an image to be formed (column 10, lines 27-29 of Sasanuma) by adding said image data supplied from

said image data supplying means and said specific hidden pattern supplied from said pattern selecting means (column 10, lines 5-9 of Sasanuma).

### ***Conclusion***

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Funada et al., US Patent 5,737,100, April 7, 1998.
